Why do I like JSTOR?

JSTOR is an academic database that contains scholarly articles from various fields and disciplines. JSTOR has huge repository of different information and each journal that they have in their database starts with the first issue and some journals date back as far as the 1800s. This shows the enormous amount of material that JSTOR contains. It also has advanced search features that allow you to make very specific searches that help you find the right articles and save you time. They also provide some very useful tutorials on how to use their features.

JSTOR also contains not just journals and articles but books, reviews, and pamphlets. In this database, you can even narrow your searches down to find only books or only reviews and find the right type of publication or text to suit your topic.
How have I used JSTOR?

I used JSTOR to compile materials for my ENG 2100 class. I had to write a paper on how the military influenced and/or created all the major technological breakthroughs. This database gave me a whole bunch of information for my topic as well as helped me make sure that the information was relevant. I found that the military had had a hand in basically every major invention of the 20th and in a sense the 21st century.

How can I use JSTOR?

This database has an enormous amount of different information for a wide range of topics. JSTOR can help you find a whole bunch of articles for any kind of topic. With their search features, you will not have to waste time looking for the things that you really need. This database helps you find the academic articles you are looking for and helps you find them quickly and efficiently.
