Database: Gale Databases

Why do I like using: I like using Gale Databases because it is a database that contains scholarly documents that range from articles to journals from many sources that are all peer-reviewed. Gale Databases contain full length scholarly content that is not centered in one subject. Instead, Gale has information that ranged from practically every subject.

As you can see from this screenshot, there is even a drop down on the right that allows you filter through the content type, subject and even document type. This helps a lot when it comes to filtering your search results. You can even cut out images.

How have I used: I used Gale Databases in my ENG 2100 class. It was a class that combined writing, the use of scholarly literature and the topic of the environment. This class was particularly dull seeing as how I did not have any interest in the environment. I used this database particularly to find scholarly information that would support the thesis of my research paper. Using Gale database helped me to find a broad range of information that related to my thesis.

How can I use: This database can come in handy when looking for scholarly articles and conducting research. This database is not particularly limited to the use of research, it can be explored and used for learning. Due to the broad topics of information as well as the extremely large content, it can be very useful for those seeking to learn about practically anything.
